Dear Valued Customer:

Starting June 16th, Ethyl Glucuronide (EtG) screening testing currently being performed by tandem mass spectrometry (LC/MS/MS) will be performed by Enzyme Immunoassay (EIA). The change to EIA enables NMS Labs to continue to keep pace with your growing needs through an increase in laboratory capacity.

- *You will experience no change in service levels – including turn around time*
- *NMS Labs will continue to utilize forensic toxicology best practices in its laboratory to help to ensure legal defensibility of results reported*
- *There is no change to confirmation testing – positive screening results will continue to be confirmed using liquid chromatography mass spectrometry (LC-MS/MS)*
- *And reporting limits are the same as previously used*

The following list is comprised of tests included in the change. Additional information about each of the tests can be found in our on-line test catalog – nmslabs.com/test-catalog.

Test Number	Test Name
8503U	Medical Professional Urine Panel 2
8506U	Basic Medical Professional Panel, Urine
8510U	Medical Professional Comprehensive Panel 4, Urine (CSA)
9360U	Ethyl Glucuronide Screen, Urine

For more than 35 years, NMS Labs has been setting the standard for excellence in clinical toxicology and forensic testing – responding to the needs of our customers with an unsurpassed scope of tests, accuracy of results and superior service levels. The above-described change allows us to maintain this level of excellence while meeting the needs of our valued customers.

Should you have any questions about this or any service offered by NMS Labs, do not hesitate to contact us. We look forward to continuing to meet your EtG testing needs.

Sincerely,

Director, Marketing
