3,4-methylenedioxyethylamphetamine (MDEA) is a sympathomimetic compound with mixed stimulant, and hallucinogenic properties. Users report that MDEA promotes empathy, and feelings of love, or emotional closeness to others. Users also report visual and tactile hallucinations, confusion, agitation, and coma. Acutely, users typically have elevated pulse and blood pressure, and dilated pupils, with slow reaction to light. The mixed stimulant and hallucinogenic effects of recreational use of this drug create a risk for impairment of the skills needed for safe driving.
